Cunext is immersed in the construction of a pioneering green copper factory in Cordoba, for the implementation of an innovative electrolysis process, which will allow the production of 100,000 tons per year of copper cathodes with the highest purity, equivalent in quality to the mining copper cathode, from recycled materials. Thanks to this innovative process, the use of primary copper from mines will be considerably reduced and the carbon footprint will be reduced by more than one million tons of CO2. The project has been partially financed by funds from the Recovery, Transformation and Resilience Plan (PRTR) - Next Generation EU, through line 1 of the PERTE for Industrial Decarbonization.
